

Dear Visitor,

please take a minute to read the requirements for this Library-Challenge

Description:

The task is to create an application that tracks the stock of a library.

General Requirements:

- The application should be written in React
- Other frameworks may be used (e.g. Bootstrap, Foundation, Semantic UI, react-redux, redux-saga, axios, reactstrap, ...).

Iteration 1

- The application should be able to display the information about all books that comes back from the API.
- The application should be responsive, and usable on both mobile and desktop devices.

Iteration 2

- The application shall be able to change information about books, and save these changes via the API
- Local changes shall be visible to the user
- The user should be able to reset a book record if he wants to discard the changes before saving them

Iteration 3

- The application shall be able to add new books and delete existing books.
- The application shall periodically check for new records if another person has changed them in the data source
